ABSTRACT

A lottery-type game has a programmed central computer system that processes various parameters from a number of racing sports events; a processor that selects and provides a receipt for recording a number of said parameters chosen by a particular player. The lottery-type game's results are determined from a selected parameter derived from the results of each of a number of the events; the selected parameter including the placings of a predetermined number of competitors for each event at the end of an event or nominated events.
